

SUSTAINABILITY BY DESIGN: FURNITURE

Furniture design is at the core of our everyday lives. Whether we are aware of it or not, furniture embraces our body and creates and defines the spaces and surfaces we interact with when working, sleeping, eating, relaxing or commuting.

Danish furniture design is characterized by a holistic approach towards integrating furniture with architecture and utility items to create coherent spaces with strong identity and ease of function. In the 1950's and 60's 'Danish Modern' manifested this approach in the most beautiful way, and today this is still the basis of the work and innovation of Danish designers and furniture companies.

On the shoulders of giants

The icons designed in the post-war period did not arise out of empty space. They were the culmination of an evolution where craftspeople, designers and architects worked in close collaboration with the manufacturing industry to combine tradition with new technology and new materials to create the physical expression of the modern welfare society. Thus, the furniture designed by Arne Jacobsen, Poul Kjærholm, Børge Mogensen and their peers was created to be not only a beautiful chair or a table, but to have a specific purpose. Often they were even designed for a specific setting or a specific building from Aarhus City Hall, schools and public libraries to the concert hall at the Louisiana Museum of Modern Art.

Though today we enjoy the beauty and simplicity of the objects, it is the integration of crafts and design with society and technology that made them come alive, and that today is still the foundation for Danish furniture design.

New materials + new technology = new possibilities

Just like 50 years ago, Danish furniture designers and manufacturers are engaged in how they can contribute to a positive development. As the focus has shifted from building the welfare state to equity on a global scale and the emerging challenges of climate change and resource scarcity, so have the objectives of the newly designed furniture.

In the new millennium, Danish furniture is following in the footsteps of the giants of the past generations while showing new ways to address the challenges of our time through continuously integrating new materials and new technology into the tradition.

WE:DO:WOOD KOMPLOT DESIGN

Fond; WE:DO:WOOD

Deforestation of especially the rain forest is a major threat to the environment.

Therefore, when the Danish carpentry firm We Do Wood was established in 2006, the partners Sebastian Jørgensen and Henrik Thygesen went looking for sustainable alternatives to the conventional wood species used for exclusive furniture – and discovered bamboo.

Bamboo grows extremely fast – over one metre a day – and in few years consumes more CO₂ than an oak tree does in centuries. Moreover, bamboo is extremely strong when used properly, reducing the need for additional glue, screws and other materials. In the Fond series, We Do Wood demonstrates how a simple and honest design enhances the qualities of the material, which in return delivers a strong and unique expression to the furniture.

NOBODY; Komplot Design, 2007 Designed for HAY

NOBODY is designed by the renowned Danish design duo Poul Christiansen and Boris Berlin – together Komplot Design – for the young progressive furniture company HAY, which was launched at IMM Cologne in 2003.

The chair is produced in a single process by thermo-pressing a felt mat of polymer fibers (PET). The production process neither demands additives like glues or resins, nor any additional materials like screws or reinforcements. PET felt is a 100 % recyclable material produced mainly from used plastic bottles.

Apart from its environmentally friendly features, the chair is light and stackable with a strong identity, and the inherent qualities of the material make it easy to clean and give it excellent acoustic qualities.
